Fibonacci Series Generator

A simple Python program that prints the first `n` terms of the Fibonacci series.

Files

- `fibonacci.py` – the main program
- `test_fibonacci.py` – unit tests for the program

Requirements

- Python 3.6 or later (no external libraries needed)

Usage

Run the program:

```
python fibonacci.py
```

Enter the number of terms when prompted:

```
Enter the number of terms: 10
0 1 1 2 3 5 8 13 21 34
```

How It Works

The series starts with 0 and 1. Each next term is the sum of the previous two:

```
0, 1, 1, 2, 3, 5, 8, 13, ...
```

The program keeps two variables, `a` and `b`, and updates them in a loop so that only the last two values are stored at any time.

Running the Tests

Keep both files in the same folder, then run:

```
python test_fibonacci.py
```

The tests cover:

Case	Input	Expected result
Zero terms	`0`	Prints nothing
One term	`1`	`0`
Five terms	`5`	`0 1 1 2 3`
Ten terms	`10`	`0 1 1 2 3 5 8 13 21 34`

Case	Input	Expected result
Twenty terms	`20`	Last term is `4181`
Negative number	`-5`	Prints nothing
Invalid input	`abc`, `3.5`, empty	Raises `ValueError`

Notes

- Entering a non-integer value stops the program with a `ValueError`.
- A negative number or `0` prints nothing.
